Happening Right Now

# THE MAGIC SYRINGE

By **Tatiana Bido**

**According to the American Society of Plastic Surgeons, fillers continue to top the most popular nonsurgical treatment list**—right behind neurotoxin injections—in the No. 2 spot year after year. With close to 3 million filler injections performed last year and 96 percent of those being performed on female patients, it's safe to say our love of fillers isn't going anywhere anytime soon. So, what's next in the world of volume-boosting injectables? Expert injectors predict next-level fillers to be more sophisticated, approved for use in more areas and sometimes even longer-lasting.

UPDATE

## Fat Factor

Microfat graft injections are another long-lasting alternative to temporary fillers. “Filler fatigue is a big reason why patients seek alternatives to hyaluronic acid fillers,” says Beverly Hills, CA plastic surgeon Leif Rogers, MD. “Renuva is an injectable treatment, but it’s technically not a filler. While Renuva does give an immediate increase in volume due to the collagen growth factors and fluid contained in the injection, it’s actually causing the growth of your own fat cells over time. After 12 to 16 weeks, Renuva completely dissolves and only your own fat remains. Your own fat cells are what cause the improvement in volume.”
